SECTION G
GEAR TRAIN AND
LOAD BRAKE ASSEMBLY

Operation Description And Maintenance Of YALE Load Brake

Purpose

The main purpose of the Yale 'Weston Screw and Disc Type' load brake is to control the lowering speed of the hoist. Its secondary purpose is to act as an auxiliary brake.

Operation

The load brake functions regardless of whether the current is on or off when lowering. When the current is off the load pulls in a counter-clockwise direction on the slow speed gear and screws the brake up tight locking all the parts of the load brake together. A pawl engages the ratchet gear and disc assembly holding the load stationary when the pull is in this direction. The greater the load, the more definite the locking action.

YA-0246

When hoisting in the up direction, power from the motor is applied through the driving pinion A to the high speed gear B. This gear with its threaded hub screws clockwise and all of the brake parts become tight and move as a unit in the clockwise direction.

NOTE: ROTATION WILL BE CLOCKWISE WHEN LOOKING INTO THE GEARING END TOWARD THE MOTOR END.

SECTION G

GEAR TRAIN AND LOAD BRAKE ASSEMBLY

Movement is free because the ratchet gear and disc assembly C is moving clockwise and it can rotate without its teeth engaging the pawl D. In this direction of rotation, the pawl is held away from the ratchet by a spring loaded friction button E which is part of the pawl assembly and presses outward simultaneously on the ratchet disc F and the high speed gear B. As the load brake rotates in this direction it tends to drag the spring loaded button with it causing the pawl to ride over the ratchet teeth ready to catch and hold the pawl the instant the load starts to lower. The load brake is completely locked when operating in this direction.

When lowering the driving pinion reverses the direction of the high speed gear, turning it counter-clockwise. This unscrews the high speed gear and loosens the load brake. At the same time the load is pulling through the gear train in a clockwise direction on the intermediate pinion K trying to tighten the brake. This interaction is constantly going on when the hoist is lowering. In a smoothly operating load brake the motor uses about one-third to one-half of its rated horsepower to drive the load down by keeping a satisfactory adjustment on the brake between the open and closed position. This operation must be just fast enough to keep the pull of the load from getting ahead and closing the brake. The load is always under control as it is the drive of the motor which lowers it while its own weight always works to close the brake.

In this lowering operation friction holds the load as the brake is just slightly open. The ratchet gear and disc assembly is held stationary by the ratchet pawl, while the high speed gear revolves. The brake discs H are bonded to the ratchet gear to form the ratchet gear and disc assembly C. The friction of the high speed gear B and reaction disc F against the stationary ratchet gear and disc assembly, with the aid of oil lubrication, produces a positive hold action permitting easy and gradual lowering.

The instant the down button is released, the high speed gear becomes stationary because the motor brake holds the driving pinion stationary and the pull of the load closes the brake as it is held by the ratchet pawl.

When the hoist lowers without a load, the high speed gear opens the brake and drives the hook down directly through the gear train. Only the friction of the normally operating gears interferes with free action and therefore such lowering is usually slightly faster than lowering with a load.

The operation of the load brake is separate from the hoisting mechanism, therefore, there is no loss of power in overcoming friction holding the load.

Load Brake Maintenance

The operation of the load brake provides automatic adjustment for wear of the brake discs. The only maintenance normally necessary is infrequent replacement of the ratchet gear and disc assembly. To check operation of load brake, See instructions in paragraphs on daily, monthly and annual inspection in preventive maintenance schedule (Section B).

SECTION G

GEAR TRAIN AND LOAD BRAKE ASSEMBLY

Load Brake Removal

- 1- Remove load.
- 2- Disconnect hoist at power supply.
- 3- Disconnect the two solenoid wires that lead to the motor brake solenoid.
- 4- Remove the drain plug at the bottom of the gear case cover and drain the oil into a can or bucket (two quart size is sufficient). **CAUTION - DO NOT REMOVE PAWL PLUG AT THIS TIME.**
- 5- Remove the eight hex head cap screws and two dowel bolt nuts holding the gear case cover to the gear case. Drive a sharp instrument between these two parts and pry the gear case cover off.

The intermediate gear J and the slow speed pinion G can now be lifted out. On all hoists that do not have a cotter pin through the pawl and ratchet pawl pin, the pawl may be removed by removing the ratchet pawl pin L and then the pawl with spring loaded friction buttons E, keeping a hand over the buttons so they will not spring out.

On all hoists that do have a cotter pin through the ratchet pawl pin and pawl, the pawl need not be removed. On these hoists remove the pawl stop spring and pull pawl away from between the ratchet disc and gear with the flat of hand over the friction buttons as they will spring out when disengaged.

SECTION GGEAR TRAIN AND
LOAD BRAKE ASSEMBLY

Load Brake Disassembly

After either one of the two preceding operations has been accomplished it is now possible to lift out the complete load brake. Place the load brake in a vise and tighten jaws over the shoulder below the intermediate pinion K. Load brake is now ready for disassembly in the following manner.

- 1- Remove the cotter pin from the castellated nut and remove nut.
- 2- Remove the high speed gear B.
- 3- Take off ratchet gear and disc assembly noting the direction the ratchet teeth are facing.

Before replacing the Ratchet Gear and Disc assembly and the high speed gear, make sure all dirt or foreign material is cleaned off.

Load Brake Re-assembly

- 1- Place the ratchet gear and disc assembly on the shaft, then thread the gear on tight.
- 2- Place spacer and bearing on the end of the shaft and press it down into the ground recess in the gear.
- 3- Tighten the castellated nut down on the bearing. Then back the nut off slowly until the first castellation lines up with the hole drilled in the shaft and slip cotter pin through this hole. Open the brake and check the adjustment by turning the ratchet gear and disc assembly. If properly adjusted it should turn freely. Bend the cotter pin around nut and cut off any excess. The assembled load brake can now be put back into gear case cover.

Load Brake Installation

- 1- Insert the load brake in the gear case cover.
 - 2- On all hoists that have a cotter pin through the pawl and ratchet pawl pin, take one button, then the spring, then the second button and slide them through the pawl in that order holding a finger over the bottom of the pawl so the buttons will not slide out. Press hard on buttons so as to compress the spring sufficiently enough to be able to slide the complete pawl in between ratchet disc and high speed gear. Replace the pawl stop spring.
- On all hoists that do not have a cotter pin through the pawl and ratchet pawl pin, assemble the pawl with buttons and friction spring. Spin the load brake around so that when installed the pawl will engage a ratchet tooth. Line up pawl between the lugs and slide in ratchet pawl pin. Press hard on the buttons so as to compress the spring sufficiently enough to be able to slide the complete pawl in between the ratchet disc and high speed gear. Replace the pawl stop spring.

SECTION J

MOTOR BRAKE ASSEMBLY

CE Series Motor Brake Assembly

Adjustment Of Brakes

YD-0332

If the load block does not come to a quick stop, the solenoid brake should be adjusted as follows:

- (1) Remove the lower cover on the gear end.
- (2) Loosen both jam nuts with an open end wrench.
- (3) With the open end wrench hold the motor brake shaft in the position it would take if the solenoid was energized and the brake was open.
- (4) Using a screw driver turn the adjusting screws until the brake lining just makes contact with the brake drum.
- (5) Remove wrench from the motor brake shaft and retighten jam nuts while holding brake adjusting screws stationary with the screw driver.

If greater braking is desired tighten the spring tension, but make sure that the spring does not bottom when the brake is fully released. When the hoist is operated the solenoid should immediately snap into the released position.

If the solenoid action is sluggish or does not release, check the action of the plunger for rust or other conditions that might cause a bind. The solenoid may be removed for inspection by taking out four bolts and pulling the solenoid straight out. The plunger will remain in the hoist.

The oil immersed load brake inside the gear housing is automatic in its action and does not require adjustment.

Silver electrical contacts should not be lubricated and should not be filed or dressed for normal operation even though they may become darkened in appearance, because silvered surfaces remain good conductors. The greatest normal life will be obtained if the contacts are not touched until replacement is required.

Operation

See back for other assemblies. YC-0252

After the hoist is determined to be running in the proper direction, check the limit switch by running the hook upward and lifting the weight by hand. When the weight is lifted the hoist should cut off. Any further lifting of the weight will close the lowering circuit and cause the hook to lower.

Traveling Nut Limit Switch Assembly**Adjustment**

To adjust the limit switches or to set them at other desired levels remove the limit switch cover. Run the unit down noticing the switch toward which the nut travels. Stop the bottom block at the desired lower limit. Remove the flat bar under the traveling nuts. Move the nut nearest the switch until the switch can be heard to trip. Replace the flat bar under the traveling nuts. Repeat the above to set the upper limit switch.

Reversing Contactors SQUARE D

AC, TYPE R - SERIES A, B AND C, THROUGH 3 HORSE POWER

ADJUSTMENT INSTRUCTIONS-If armature solenoid is removed, it should be adjusted when reassembled by screwing armature within 13/64 (Series A) or 15/64 (Series B and C) of magnet core and locking with slotted nut to 20 in.-lbs. torque.

CONTACTS-To inspect the contacts, remove contact block 1. All contacts are silver alloy and are not harmed by discoloration and slight pitting. DO NOT FILE THEM; replace only when silver has worn thin. Movable contact finger 5 is removed by pulling straight out. To release stationary contacts 4, unscrew from underside of contact block 1.

When contacts are replaced, contact springs 6 should also be replaced.

A complete set of replacement contacts may be obtained by ordering part number 6400028-00 contact parts kit.

MAGNET COILS-To replace magnet coil 18, first disconnect coil leads. Next, remove coil jumper 13 connecting the two coils together. Remove screws 20 which release the bottom plate 19. Slide the coil from the magnet frame.

BOTH ARMATURE ASSEMBLIES MUST BE COMPLETELY DROPPED OUT WHEN THE ELECTRICAL INTERLOCK IS INSTALLED.

FIGURE 1.

NOTE: DO NOT FILE CONTACT TIPS

FIGURE 2.

DISASSEMBLY

1. Remove contact block assembly (See B in Figure 2) by removing screws at A.
2. Remove magnet retainers at C.
3. Pull contact carrier, along with magnet, armature and coil, from base.
4. Remove coil by releasing armature clip D.

3 POLE CONTACT REPLACEMENT KIT 6455898-00

All contact replacement kits contain a contact block assembly including N.O. stationary contacts, movable contacts, return springs and contact springs.

When ordering replacement coils give part number, voltage and frequency of coil being replaced.

REASSEMBLY

1. Place magnet onto coil so flat side of coil is adjacent to pole faces of magnet.
2. Slide contact carrier down over magnet and coil. Secure armature to carrier legs with clip. Machined surfaces of armature must rest against magnet pole faces.
3. Place assembly and electrical interlock (if used) into base housing.
4. Place magnet retainers (See C in Figure 2) in position with the long extension on retainers engaging magnet.
5. Place contact block assembly onto base housing while guiding return springs into proper position in contact block. Replace and tighten screws at A.

HOISTS

WARRANTY

Every hoist is thoroughly inspected and tested prior to shipment from the factory. Should any problems develop, return the complete hoist prepaid to your nearest Yale Hoists Authorized Warranty Repair Station.

This warranty does not apply where: (1) deterioration is caused by normal wear, abuse, improper or inadequate power supply, eccentric or side loading, overloading, chemical or abrasive actions, improper maintenance or excessive heat; (2) problems resulted from repairs, modifications or

alterations made by persons other than factory or Yale Hoists personnel; (3) the hoist has been abused or damaged as a result of an accident; (4) repair parts or accessories other than those supplied by Yale Hoists are used on the hoist.

Equipment and accessories not of the seller's manufacture are warranted only to the extent that they are warranted by the manufacturer. EXCEPT AS STATED HEREIN, YALE HOISTS MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Improvements:

Yale Hoists is constantly striving to improve its product. Changes in design and improvements will be made whenever manufacturer believes the efficiency of the product will be improved without incurring any obligation to incorporate such improvements in any products which have been shipped or are in service.

Important Notice:

Use of chain, wire rope or replacement parts other than as supplied as original equipment on Yale hoists may lead to dangerous operation. Accordingly, Yale Hoists cannot be responsible in such cases and our warranty will be voided.

For more information, write Yale Hoists, Forrest City, Arkansas 72335.
