

October 11, 2019

Penn A Kem

Subject: October vibration service

Most of the machines surveyed were found to be in good condition with the exception of the following:

QualiTest® uses a four step rating system for defects.

Class I: Defect is present, but effect on reliability is not clear; no immediate action is required. Continue to normally monitor.

Class II: Defect (s) present that may cause problem in long term (2-6 months.). Repair during normal maintenance scheduling. Continue to monitor.

Class III: Defect (s) present that may cause failure in short term (less than 2 months.). This should be addressed as soon as practical, with a high maintenance priority. Increase monitoring frequency.

Class IV: Defect (s) present that makes continued reliability unpredictable, and possibility of secondary damage is high. Repairs should be made ASAP. An unscheduled shutdown should be considered for repairs

Hi-Speed Industrial Service tests and inspects industrial machinery and equipment and makes recommendations concerning maintenance and repairs based on its experience in the field of industrial repair and maintenance. The information contained herein is provided as an opinion only, not as a guaranty or warranty of the matters discussed herein.

This completes our assessment of your equipment for this survey. Thank you for your business and don't hesitate to call if you have any comments or questions.

Sincerely,

David W. Shook
Senior Reliability Specialists
Hi-Speed Industrial Service
dshook@gohispeed.com

Observations

P81-101B West Fire Pump

The unit had a terrible screeching sound during testing. This could have been the bearing rolling elements sliding. Non-synchronous vibrations were seen in the data for both the motor and pump bearings; which indicate defect frequencies are present. We recommend having the unit's bearings and seals replaced and any other consumable parts inspected and replaced as needed. **Rated a Class III Defect based on this survey.**

P24-63DEGN 63 Degree North Water Pump

Random impacting in the data is usually a good indicator of the presence of bearing defects. The addition of a large noise hump could help to support the analysis or sometimes it could indicate cavitation in the pump or both. We still suspect the bearings are in some distress with possible cavitation. Inspect the outboard pump bearing and check process parameters as time allows. **Rated a Class II Defect.**

P24-85DEGS: 85 Degree South Circulating Water Pump

Vibration data still consists of: vane pass and harmonics, slightly elevated noise floor and impacting in the time waveform. We suspect the pump is worn and not running in the optimal area of the performance curve. Have the flow and pressure's checked as time allows. We will watch for changes. **Rated a Class II Defect.**

P24-85DEGN: 85 Degree North Circulating Water Pump

The pump vibration data still consists of noise in the spectrums and impacting in time waveforms. We suspect the pump bearings and fits could be severely worn; however, cavitation can sometimes look similar in the data. Inspect the pump and process parameters for issues as time allows. We will watch carefully for changes. **Rated a Class II Defect.**

P48-7B Rotojet Pump (NOT 7A)

This pump has a high vibration at near 79 Hz. Inspect the pump impeller for wear that would cause imbalance. **Rated a Class II Defect.**

R48-2 Reactor Agitator

Unit motor has overall vibration at almost 1/2" per second velocity peak. Inspect the motor and drive train for issues. **Rated a Class II Defect.**

R55-102 Reactor Agitator

The unit gearbox or input coupling could be in severe distress. We recommend an inspection of the drivetrain and oil analysis of the gearbox oil to confirm. Impacting can be seen in the time domain. The gearbox seemed to be generating audible noises too; which also concerns us. Inspect as soon as practical. **Rated a Class III Defect.**

B76-101 FD Fan East

The motor and fan still have vibrations at around 0.5"/sec velocity peak at near 43 Hz. Harmonics are also present in the fan bearings. Inspect the belts and sheaves for wear. Check all fasteners. Perform a lift check on the fan shaft to determine if there is excessive clearances. Replace worn or damaged parts. **Rated a Class II Defect.**

B82-101A FD Fan South

Motor axial is still slightly high. Inspect the unit and clean the wheel. **Rated a Class I Defect.**

CHLR45-1 20 Ton Trane Chiller

The East and West pump vibrations at the top horizontals are still around 1"/sec velocity peak. We will watch for changes. **Rated a Class I Defect.**

September report notes:**P54-112B Canned Motor Centrifugal Pump.**

Not Running This Survey

Reported last month

The unit case is split and leaking from what looks to be previous hard freeze damage.

R53-301 Agitator

Not Running This Survey

Reported last month

The high amplitude vibration data could indicate an issue in or adjacent to the motor. Ensure all fasteners are tight. Inspect the motor cooling fan and the shaft coupling for wear or damage. Have the shaft alignment checked and adjusted if necessary. Vibrations over 1"/sec velocity peak require attention. **Rated a Class III Defect.**

Still

B82-101B FD Fan North

Not Running This Survey

Reported last month

This unit should be shut down and inspected as soon as possible. The likelihood of secondary damage is extremely conceivable if allowed to run. Unit area should be barricaded until repairs are completed. Vibrations are over 3"/sec velocity peak in the time waveform of the motor inboard vertical and dominated by the shaft fundamental. We suspect imbalance and other factors such as loose fasteners, looseness in the bearing fits and possible structural defects. **Rated a Class IV Defect.**

Overall vibrations

Abbreviated Last Measurement Summary

Database: penn.rbm
